EXPERIMENT 02

Account setup and platform exploration

Aim

Set up an authorized Zoho Creator workspace and identify the platform components used to build and run the library application.

Procedure

1. Create or sign in to the institution-approved account. Verify the email, enable multi-factor authentication where administered, and record the organization and data center without copying secrets into the record.

2. Record the current plan or trial, allowed users, record capacity, API allowance, and whether environments and custom permissions are available. Use current account information rather than an assumed plan entitlement.

3. Create an application named Library Book Issue Management System. Record its app link name, for example library-book-issue-management. Set locale, date display, and the intended timezone.

4. Explore edit mode and live mode. Identify forms for data entry, reports for viewing records, pages for dashboards, and workflows for event-driven logic. Locate users, connections, logs, and environment controls if available.

5. Create a temporary Sandbox_Check form with a single text field. Submit one synthetic record in live mode and view it in a report. Confirm that form configuration and stored records are different parts of the application.

6. Draw the architecture as Browser or Mobile Client → Creator UI → Permissions and Workflows → Creator Data. Add an outbound connection to CRM and a separate optional Catalyst service.

Implementation and verification

7. Remove the temporary record and form only after checking that they have no dependencies. Begin the permanent forms in Experiment 4. Keep the app private.

Exploration checklist

Component	What to identify
Form builder	Field type, display name, link name, required and uniqueness settings.
Workflow editor	On Validate, On Success, schedules and reusable functions.
Reports and pages	Source form, filters, record detail and dashboard components.
Administration	Users, permissions, connection ownership, logs and environments.

Evidence and testing

E02: redacted application overview, architecture sketch, plan checklist, and one temporary test record before cleanup. Verify that a logged-out user cannot open private data. Record absent menu items instead of assuming setup failed.

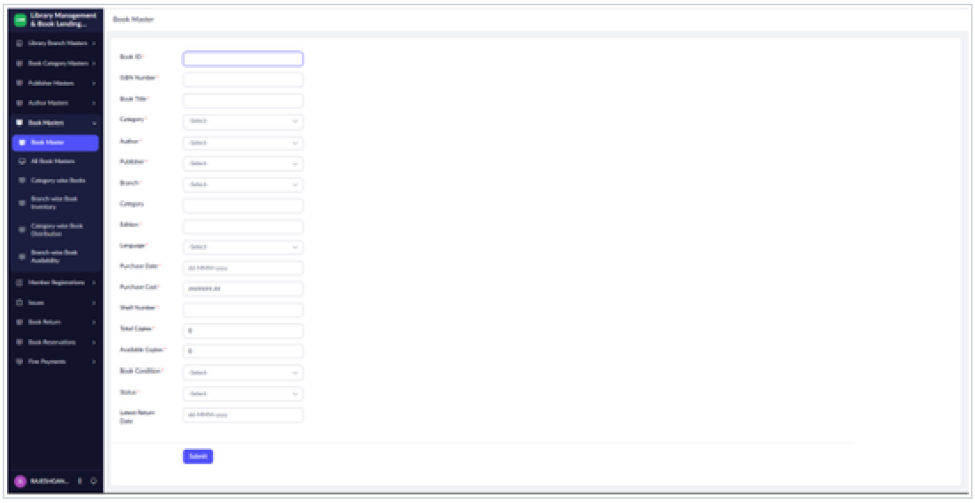

Implementation and interpretation

The supplied application screens show the navigation menu, entry form and report view. They support discussion of the application interface; they do not establish account registration, multi-factor authentication or plan entitlement. Verify those settings separately in the authorized account.

EXPERIMENT 02 VISUAL RECORD

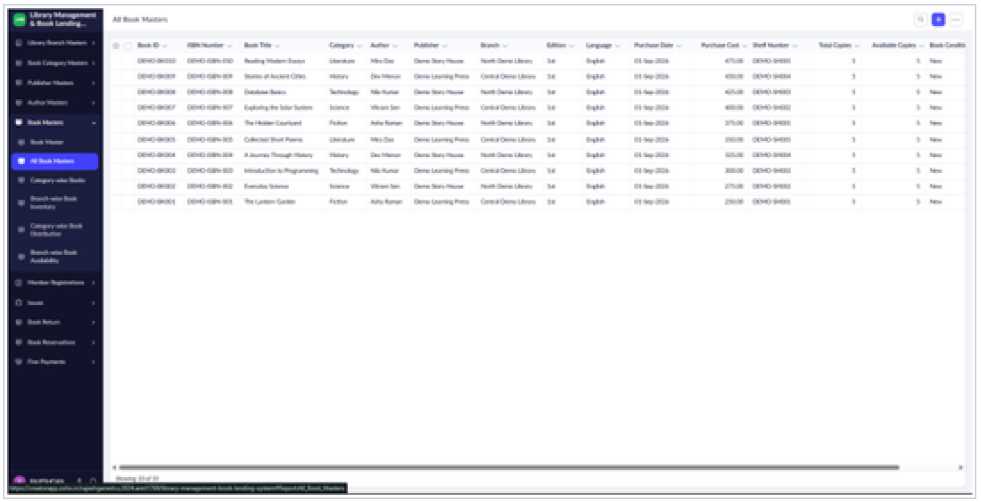

Application images and explanation

Book Master entry form

Supplied application screenshot from the uploaded library document.

All Book Masters report

Supplied application screenshot from the uploaded library document.

The supplied application screens show the navigation menu, entry form and report view. They support discussion of the application interface; they do not establish account registration, multi-factor authentication or plan entitlement. Verify those settings separately in the authorized account.

Result

Expected result and verification criteria. The account and private app are ready for modelling, a synthetic record can be submitted and retrieved, and the student can explain the role of each major component. Account-dependent features are recorded accurately.
