EXPERIMENT 03

Survey of emerging low code trends

Aim

Prepare a source-based survey report on emerging low code practices and evaluate their relevance to the library application.

Procedure

1. Define the survey questions: Which development tasks are assisted by AI? How are integrations governed? What remains a developer responsibility? What changes when applications become business-critical?

2. Conduct a desk survey using current primary documentation for Creator, Deluge, CRM APIs and Catalyst. Record title, URL, access date, product scope and any licensing conditions. Use at least five sources from official product documentation, and add another vendor source if making cross-platform claims.

3. Classify the evidence into AI-assisted development, conversational interfaces, API integration, governed citizen development, embedded analytics, and hybrid low code plus pro code.

4. For each trend, distinguish a documented feature from an interpretation about its future impact. Do not convert a product feature list into a market-share or adoption statistic.

5. Optionally collect a small voluntary questionnaire from students or developers: prior experience, tools used, usefulness of AI, integration difficulty, testing practices and governance concerns. Record sample size and selection method; do not invent responses.

Implementation and verification

6. Write a short report containing objective, method, evidence table, discussion, limitations and conclusion. If no respondents participate, label it a desk survey and omit quantitative respondent findings.

Trend	Library use	Evaluation question
AI assistance	Draft forms or validation scripts.	Does a human review catch unsafe or incorrect logic?
API composition	Synchronize approved members to CRM.	Can retries avoid duplicate contacts?
Governed development	Separate builders and circulation staff.	Who approves releases and access changes?
Built in analytics	Monitor open and overdue loans.	Do totals reconcile with source records?
Hybrid architecture	Offload a specialized computation.	Is the added service worth its operational cost?

Evidence and testing

E03: bibliography, source extraction table, and a finished discussion. For an optional questionnaire, keep anonymized raw counts and calculate percentages using the stated denominator. Acknowledge selection bias and limited sample size.

Implementation and interpretation

A desk survey is valid when its method and sources are clear. A product demonstration can show that a capability exists, but it cannot establish industry adoption or future employment demand. Compare evidence quality and account prerequisites before drawing conclusions.

EXPERIMENT 03 VISUAL RECORD

Application images and explanation

Illustrative process diagram

Generated explanatory diagram. It is not a screenshot of an executed workflow.

A desk survey is valid when its method and sources are clear. A product demonstration can show that a capability exists, but it cannot establish industry adoption or future employment demand. Compare evidence quality and account prerequisites before drawing conclusions.

Result

Expected result and verification criteria. The report explains at least five trends with traceable evidence and practical implications. Documented capabilities, predictions, and any collected responses are clearly separated; no survey participation is implied without data.
